ABSTRACT

The focus of this report is a normative profile of Jewish freshmen entering college in the fall of 1969. Using data obtained from the Cooperative Institutional Research Program (CIRP), information was secured on Jewish freshmen. This data was compared with data collected in previous years. The basic approach in this report was to include the responses of both Jewish student and non-Jewish students. However, the other religions are grouped together, since this is a study of religious affiliation. There are three sets of tables which comprise the major statistical presentation of this report: (1) men; (2) women; and (3) all freshmen. The results are presented in terms of the percentages who responded to each item of the student information questionnaire which the CIRP used to collect its data. Items included in the tables are: (1) age; (2) grade point average in high school; (3) secondary school achievement; (4) highest degree planned; (5) probable major field of study; (6) probable career; (7) father's education; (8) mother's education; and (9) parental income. AMERICAN COUNCIL ON EDUCATION LOGAN WILSON, PRESIDENT

THE AMERICAN COUNCIL ON EDUCATION, FOUNDED IN 1919, IS A COUNCIL OF EDUCATIONAL ORGANIZATIONS AND INSTITUTIONS. ITS PURPOSE IS TO ADVANCE EDUCATION AND EDUCATIONAL METHODS THROUGH COMPREHENSIVE VOLUNTARY AND COOPERATIVE ACTION ON THE PART OF AMERICAN EDUCATIONAL ASSOCIATIONS, ORGANIZATIONS, AND INSTITUTIONS.

THE COUNCIL'S OFFICE OF RESEARCH WAS ESTABLISHED IN 1965 TO ASSUME RESPONSIBILITY FOR CONDUCTING RESEARCH ON QUESTIONS OF GENERAL CONCERN TO HIGHER EDUCATION. ACE RESEARCH REPORTS ARE DESIGNED TO EXPEDITE COMMUNICATION OF THE OFFICE'S RESEARCH FINDINGS TO A LIMITED NUMBER OF EDUCATIONAL RESEARCHERS AND OTHER INTERESTED PERSONS.

ACE RESEARCH REPORTS

Vol. 5, No. 4

June, 1970

Acknowledgements

The preparation of this research report was funded by the American Jewish Committee, a human relations agency with a commitment to objective scientific research, particularly with respect to educational and social issues. The AJC has supported a number of significant research efforts in the past, most notably the classic Authoritarian Personality study. Discussion of a profile such as this was initiated by Saul Rossien, formerly Director of Education at AJC; subsequently, Mrs. Geraldine Rosenfield became the AJC coordinator with the Council for the project.

As indicated in the text, this report is a special product of the more general Cooperative Institutional Research Program, of which Alexander W. Astin is the Director. Dr. Astin and my other colleagues provided valuable comments and aid during preparation of this report. John A. Creager was particularly helpful with respect to methodological issues concerning the sampling and weighting procedures. Alan E. Bayer and Robert F. Boruch provided suggestions based on their experience in preparing a previous report on black students.

The production of this report was dependent upon the development of some complex computer software. The several programming tasks involved in preparing and implementing these routines were handled excellently by Jeffrey E. Dutton, Penny L. Edgert and Gerald T. Richardson.

Janice C. Peterson provided valuable assistance in virtually every phase of this project.

A Profile of the Jewish Freshman¹ David E. Drew

The focus of this report is a normative profile of Jewish freshmen entering college in the fall of 1969. The purpose of the following sections is to describe the research program and methodology which generated this information.

The Cooperative Institutional Research Program

The data presented in this research report are a direct product of the Cooperative Institutional Research Program being conducted by the Office of Research of the American Council on Education. Since this program was launched in 1966, over a million undergraduates have completed questionnaires. Preliminary work prior to the CIRP program included a prototype study carried out with students who entered college in 1961 and a pilot study of 1965 freshmen. Each fall since 1966, when the full-scale research program was launched, approximately a quarter of a million students from a wide range of colleges and universities have filled out questionnaires containing items about their previous academic experiences, educational and professional aspirations, attitudes, etc. In addition, follow-up questionnaires have been sent to subsamples of each entering cohort at periodic intervals. For example, the initial group of 1966 entering freshmen received a one-year follow-up in August of 1967 as well as a questionnaire which arrived during December of 1969, their senior year.

¹This research was supported in part by the American Jewish Committee and by National Science Foundation Grant GR-57.

In addition, this group will receive a questionnaire late this summer after many of them will have graduated from college.

The basic longitudinal characteristics of the research program have enabled social scientists within the Office of Research to carry out a number of studies with respect to such topics as the dimensions of the college environment (Astin, 1968) and the educational and vocational development of college students (Astin and Panos, 1969). The development of a complex set of weighting procedures (Creager, 1968) has allowed production of a series of normative reports, both on entering freshmen (e.g., Creager, Astin, Boruch, Bayer and Drew, 1969) and at subsequent intervals in the college experience (Bayer, Drew, Astin, Boruch and Creager, 1970). An accessing system has been established to make these data available to a wide range of social and educational researchers (Bayer, Astin, Boruch and Creager, 1969); concurrently a series of steps have been taken to assure the confidentiality of the information provided by the research subjects (Astin and Boruch, 1970).

In the context of this research program it is possible to make estimates of the national distribution of responses for specific groups of students. The first such attempt was a report on black students (Bayer and Boruch, 1969), which in some respects has served as the model for the present work. Few research endeavors, particularly in the field of higher education, have been able to rely upon a large enough sample to allow extensive descriptive statements about a subgroup, for example Jewish students, which constitutes a relatively small percentage of the total undergraduate population.

The 1969 Sample

In the fall of 1969, as in previous years, a wide array of institutions were invited to participate in the research program--two-year colleges, four-year colleges and universities; public and private schools; predominantly black as well as predominantly white schools, etc. A complex, stratified sampling design was employed which, when combined with the proper weighting scheme, provided descriptive statements about the national population. The basic dimensions along which the sample of institutions was stratified were:

- --two-year, four-year, university
- --selectivity (average academic performance scores of entering freshmen)
- --affluence (per student expenditures for educational and general purposes)
- --public, private nonsectarian, Roman Catholic, other sectarian
- --predominantly Negro schools

An exact delineation of the population of institutions referred to here is in order. The Council, basically, followed the definition embodied by the U. S. Office of Education in its <u>Education Directory</u> (USOE, 1968). Excluded, however, are schools which have a freshman class of less than thirty students and some schools which require undergraduate credits as a criterion of admission into the school. Thus, in this report, the sample reflects a population of 2,433 eligible, functioning institutions.

The precise manner in which the stratification criteria were combined in our sampling design is indicated in Figure 1 which also contains information about the number of schools in each stratification cell of the population.

While only a sample of the entire population of institutions of higher education was included, within each school an attempt was made to administer a questionnaire to each entering freshman (but not to transfer students). Since a 100% response rate within institutions was not always possible, particularly given the voluntary nature of the task, stringent criteria were employed by the Office of Research staff in determining whether the response rate within a given institution was adequate. Schools with low response rates were not included in the national normative profile. In addition, the weighting scheme began with an attempt to compensate for any biases which might have remained even in those high response rate institutions which were retained. Thus, the final weight applied to a given questionnaire in the statistical analyses was a function of several components. The first component was a weight which compensated for the response rate within the institution (differentially by sex). A second weight compensated for differential sampling of institutions within stratification cells and adjusted the student counts to represent the total first-time, full-time enrollment of all schools in the Institutions from each of the thirty-five stratification cells were combined to give a total picture of the national distribution. Table 1 indicates the weights which were used in each of those stratification cells. A detailed description of these weighting procedures has been given in a previous Council publication (Creager, 1968).

There will be some slight differences between information reported here and comparable data in the published 1969 national norms report (Creager, Astin, Boruch, Bayer and Drew, 1969), e.g., in the weights for cells 34 and 35. This is due to the fact that the entire 1969 national norms were recomputed recently with some minor refinements in the sample.

The Student Information Form

The basic freshman questionnaire upon which this report is based is a four page document containing a series of multiple-choice items. A copy of the form used in the fall of 1969 is attached as Appendix A. In fact, this questionnaire is very similar to those used in the previous years of the Cooperative Institutional Research Program. As before, the questionnaire was constructed so that the responses can be recognized by optical scanning equipment and converted into a data tape for subsequent computer analysis. Experience with the questionnaires from prior years has provided, of course, extensive pretesting of most of the items. Bear in mind that the responses to these questions were given by the freshmen after matriculation but before they experienced college, i.e., during their orientation period. Thus, these responses not only make possible reports such as this one descriptive of entering college freshmen but also provide a bench mark for studies of college impact and other longitudinal research.

The National Normative Profile of Jewish Students

As can be seen in Appendix A, entering freshmen in 1969 were asked two questions dealing with their religion:

"Religion in which you were reared"

"Your present religious preference"

The former item was used in making the basic determination as to which students in the sample were Jewish. In 1969, this group comprised 4.2% of the total cohort of entering freshmen. Table 2 extends this information by including

the categories of two-year colleges, four-year colleges and universities and compares these data with the percentages found each year since the inception of the Cooperative Institutional Research Program. The figures, of course, are taken from the national norms reports for these years. Also included in those documents is religious background data for some other categories of institutions, most of which, typically, have few Jewish students, e.g., predominantly black schools, Catholic colleges, etc.

The basic approach in this report has been to include the responses of both Jewish students and non-Jewish students. However, the latter group has been redefined as "other religions," inasmuch as this is a study of religious affiliation; therefore, those students from the comparison group who had indicated that the religion in which they were reared was "none" are excluded. Thus, in the tables below each "other religions" group is composed of the weighted responses of those students who gave any response to the above question except "Jewish" and "none." Table 3 indicates the percentages of students from each specific religion within the "other religions" category. Table 4 presents the number of actual participants (male and female) for both the Jewish and "other religions" categories as well as the weighted population estimates.

There are three sets of tables which comprise the major statistical presentation of this report: one for men, one for women, and one for all freshmen combined. Each table includes Jewish students and those of other religions in all institutions, two-year colleges, four-year colleges and universities. The results are presented in terms of the percentages who responded to each item. The percentages, in fact, are weighted in the manner described above so as to

approximate the national percentage for each item. All major items in the questionnaire are presented.³ Because of space requirements, the standard Council procedure was followed in the case of a few items to collapse several fine categories into a broader rubric. The criteria used in making these decisions are included in Appendix B.

The strength of these tables as indicators of the national percentages lies in the sampling and weighting procedures discussed above. In any report such as this based on a subset of the entire student population there is a possible error which could be traced to the fact that the defining criterion had not been one of the basic stratification dimensions. Such a discrepancy is relatively greater at the ends of the continuum where the base rate for a given item is less than ten percent or greater than ninety percent. Thus, caution should be exercised in using these percentages, particularly at the extremes, in an attempt to make precise estimates of headcounts, for example in facility planning. In comparing weighted responses given by different groups of students in tables such as these the issue of statistical significance is clouded, while practical significance is a function of the purpose with which the tables are examined. For most items and purposes a difference of five percent is of practical significance. In general, because of the number of students involved, slightly more confidence can be placed in the percentages from the "all institutions" column than from any of the subdivisions

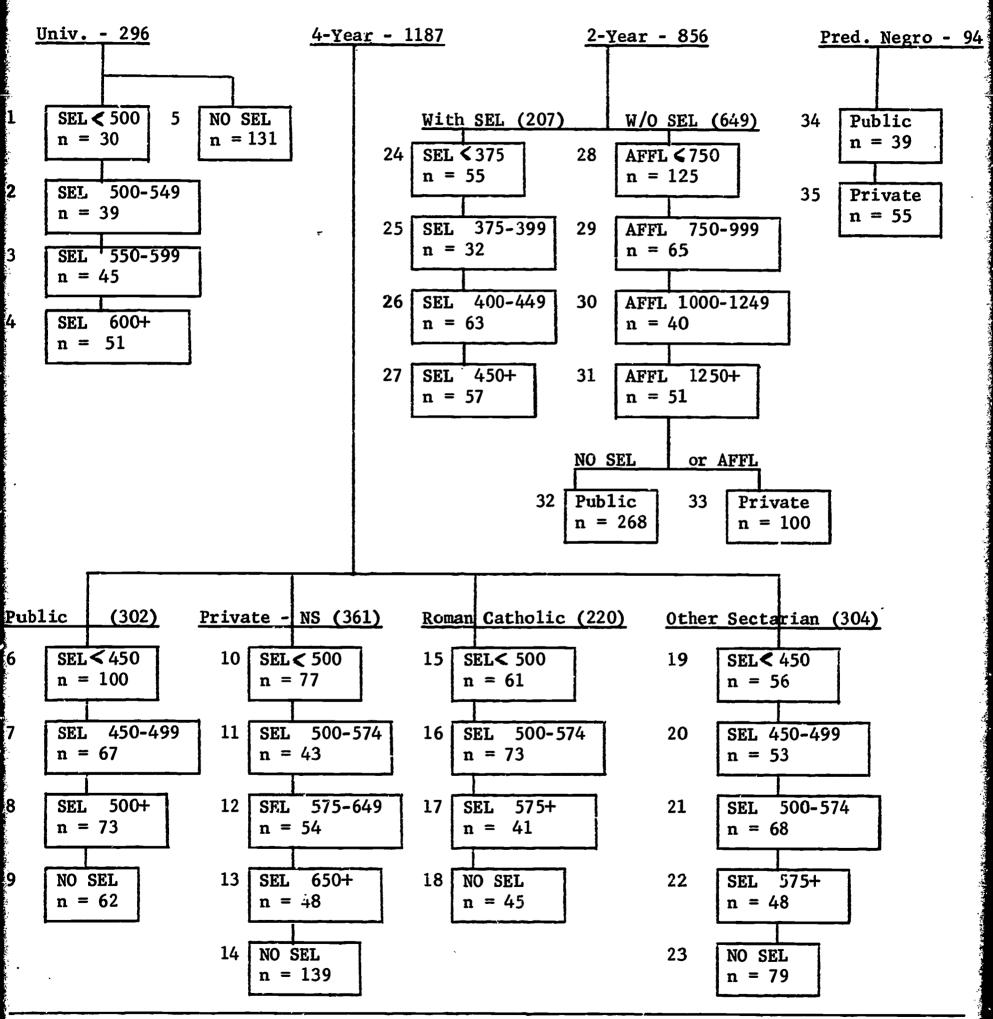

These items are the same as those presented in the national norms (Creager, Astin, Boruch, Bayer and Drew, 1969). The only exception (in addition to religious background itself, on which the group breakdowns were made) is the omission of the item concerning the student's home state (region) due to a data processing error.

of that category such as two-year colleges, four-year colleges, etc. The reader should bear in mind that there may be much variation within Each category, e.g., four-year colleges, with respect to a specific item.

Figure 1

⁽¹⁾ As indicated in the text, two items have been omitted from these tables--religious background itself and region of home state.

⁽²⁾ Reported estimate of total income of parental family last year (all sources before taxes).

⁽³⁾ Increase involvement or initiate crash program.

⁽⁴⁾ Frequently only, all other items frequently plus occasionally.
